

Presumptive diseases

At times I heard veterans saying “I have Agent Orange disease”. Agent Orange is not a disease. It is an herbicide used in Vietnam to defoliate areas of vegetation to deny the enemy cover. However, exposure to Agent Orange has been proven to result in certain diseases which have been found to occur after service in Vietnam. Certain veterans are eligible for disability compensation based on the presumption that their disability is service-connected. This leads me to this month’s subject, Presumptive Conditions for Disability Compensation.

Presumptive Conditions for Disability Compensation: All veterans who develop Amyotrophic Lateral Sclerosis (ALS), also known as Lou Gehrig’s disease, at any time after separation from service may be eligible for compensation for that disability.

Prisoners of War: For former POWs who were imprisoned for any length of time, the following disabilities are presumed to be service-connected if they are rated at least 10 percent disabling anytime after military service: psychosis, any of the anxiety states, dysthymic disorder, organic residuals of frostbite, post-traumatic osteoarthritis, heart disease or hypertensive vascular disease and their complications, stroke, residuals of stroke and effective October 10, 2008, osteoporosis if the veteran has post-traumatic stress disorder (PTSD).

For former POWs who were imprisoned for at least 30 days, the following conditions are also presumed to be service-connected: avitaminosis, beriberi, chronic dysentery, helminthiasis, malnutrition (including optic atrophy), pellagra and/or other nutritional deficiencies, irritable bowel syndrome, peptic ulcer disease, peripheral neuropathy, cirrhosis of the liver and effective September 28, 2009, osteoporosis.

Veterans Exposed to Agent Orange and Other Herbicides: A veteran who served in the Republic of Vietnam between Jan. 9, 1962, and May 7, 1975, is presumed to have been exposed to Agent Orange and other herbicides used in support of military operations.

Twelve illnesses are presumed by VA to be service-connected for such veterans: chloracne or other acneform disease similar to chloracne, porphyria cutanea tarda, soft-tissue sarcoma (other than osteosarcoma, chondrosarcoma, Kaposi’s sarcoma or mesothelioma), Hodgkin’s disease, multiple myeloma, respiratory cancers (lung, bronchus, larynx, trachea), non-Hodgkin’s lymphoma, prostate cancer, acute and subacute peripheral neuropathy, diabetes mellitus (Type 2), chronic lymphocytic leukemia and AL amyloidosis.. (Recently the VA found certain types of heart disease to be included in this presumptive class. Regulations regarding heart disease are being published at this time.)

Veterans Exposed to Radiation: For veterans who participated in “radiation risk activities” as defined in VA regulations while on active duty, active duty for training, or inactive duty training, the following conditions are presumed to be service-connected: all forms of leukemia (except for chronic lymphocytic leukemia); cancer of the thyroid, breast, pharynx, esophagus, stomach, small intestine, pancreas, bile ducts, gall bladder, salivary gland, urinary tract (renal pelvis, ureter, urinary bladder and urethra), brain, bone, lung, colon, and ovary, bronchiolo-alveolar carcinoma, multiple myeloma, lymphomas (other than Hodgkin’s disease), and primary liver cancer (except if cirrhosis or hepatitis B is indicated).

To determine service connection for other conditions or exposures not eligible for presumptive service connection, VA considers factors such as the amount of radiation exposure, duration of exposure, elapsed time between exposure and onset of the disease, gender and family history, age at time of exposure, the extent to which a non service-related exposure could contribute to disease, and the relative sensitivity of exposed tissue.

Gulf War Veterans with Chronic Disabilities: may receive disability compensation for chronic disabilities resulting from undiagnosed illnesses and/or medically unexplained chronic multi-symptom illnesses defined by a cluster of signs or symptoms. A disability is considered chronic if it has existed for at least six months.

The undiagnosed illnesses must have appeared either during active service in the Southwest Asia Theater of Operations during the Gulf War period of Aug. 2, 1990, to July 31, 1991, or to a degree of at least 10 percent at any time since then through Dec. 31, 2011. This theater of operations includes Iraq, Kuwait, Saudi Arabia, the neutral zone between Iraq and Saudi Arabia, Bahrain, Qatar, the United Arab Emirates, Oman, the Gulf of Aden, the Gulf of Oman, the Persian Gulf, the Arabian Sea, the Red Sea, and the airspace above these locations.

The following are examples of symptoms of an undiagnosed illness: chronic fatigue syndrome, fibromyalgia, skin disorders, headache, muscle pain, joint pain, neurological symptoms, neuropsychological symptoms, symptoms involving the respiratory system, sleep disturbances, gastrointestinal symptoms, cardiovascular symptoms, abnormal weight loss, and menstrual disorders.
